Healthy Youth Survey 2004 Survey Results

Statewide Results, Grade 8

Number of students surveyed: 8858

Number of valid responses: 8466

Introduction and Overview

The impact of adolescent health risk behaviors remains a primary concern of citizens throughout the country. Many health problems experienced by adolescents are caused by a very few preventable behaviors. Patterns of alcohol, tobacco, and other drug (ATOD) use and related risk behaviors are often formed during adolescence. These patterns play an important role in health throughout adulthood.

This report presents results from the fall 2004 Healthy Youth Survey in Washington State. This survey was sponsored by the Office of Superintendent of Public Instruction; the Department of Health; the Department of Social and Health Services; the Department of Community, Trade and Economic Development; and the Family Policy Council, in cooperation with schools throughout the state of Washington.

For each item, local results appear in the first two columns and statewide results appear in the second two columns. The number of valid responses (“*n*”) appears in parentheses for each item. Survey items covering the same topics are grouped together (the item numbering is specific to this report and does not necessarily reflect the item order on the actual survey). The bulleted points and graphs included at the beginning of this report highlight selected findings. Additional information may be found in the *Interpretive Guide* that accompanied this report.

Key to the Notes

The survey was administered in 3 versions. Forms A and B were administered to students in Grades 8, 10, and 12. These two forms contained a core set of common items (see “List of Core Items” on the last page of this report) and additional items unique to each form. Form C was administered to students in Grade 6. This form consisted primarily of items drawn from Forms A and B but also included some unique items. Several items on each form were optional at the discretion of the school; schools that did not administer the optional items tore off the last page of the survey booklet. The following notes are used throughout this report to document the differences between the items on different versions and indicate the optional items:

A = wording on Form A

B = wording on Form B

C = wording on Form C

† = optional item

Selected Results by Gender

Selected items are presented by gender to highlight any differences between females and males. The p-values reported after each item can be used to examine whether differences in the local data between females and males are statistically significant. To ensure student anonymity, local results are suppressed for each item on this page if any cell (e.g., females who reported smoking) represented fewer than 15 students.

Alcohol, Tobacco, and Other Drug Use

Alcohol, tobacco, and other drug use has been a major concern in this country for many years. The consequences of ATOD use are well known. In the short term, ATOD use interferes with positive physical, emotional, and social development. In the long term, ATOD use is associated with delinquency and criminal activity, unintended injuries, and a variety of health complications including shorter life expectancy. The economic costs of ATOD use are enormous (in Washington State an estimated \$1.81 billion in 1990 and \$2.54 billion in 1996). Tobacco use is the world's leading cause of preventable death, disease, and disability. This section provides information about lifetime ATOD use (which in part reflects experimental use), use in the past 30 days (i.e., current use), and other tobacco-, alcohol-, and drug-related issues.

Other Health Concerns

This section provides results regarding other health concerns including nutrition and fitness, health conditions and health care, safety, behaviors related to intentional injury, and depression. Proper nutrition and exercise are critical components of a healthy life, as is access to preventive health care. Safety-related behaviors, such as wearing a seat belt when in a moving vehicle, can profoundly influence the outcome of an accident. Injury is the leading cause of death for adolescents aged 10 to 19, and violence contributes to injury-related deaths. People who are depressed experience a range of symptoms, and depression is associated with suicidal behavior.

Risk and Protective Factors

Decades of research have shown that certain risk factors are associated with increased likelihood of health risk behaviors including ATOD use, violence, and delinquent behaviors. Similarly, research has shown that protective factors exert a positive influence against the negative influence of risk factors. The survey included substantial coverage of risk and protective factors based on the work of Drs. Hawkins and Catalano and associates at the University of Washington. The premise of the risk reduction and protective factor enhancement approach to prevention is that preventing a problem before it occurs requires addressing the factors that predict the problem. Ideally, this strategy entails discovering the causes of the problem behavior and influencing those causes. Many of the survey items were used to assess students' status on risk and protective factors in the community, school, and peer-individual domains. Composite scales were computed for use in local program planning.

The table on the following page provides the complete list of risk and protective factors and indicates the years the Healthy Youth Survey has included each factor.

Risk and Protective Factor Scale Results

For each *risk* factor scale, the percentage of students who are at risk (i.e., who agreed with statements that predict ATOD use or other problem behaviors) is reported; higher percentages indicate that *more* students are likely to engage in problem behaviors. For each *protective* factor scale, the percentage of students who are resilient (i.e., who agreed with statements that predict the ability to resist ATOD use or other problem behaviors) is reported; higher percentages indicate that *fewer* students are likely to engage in problem behaviors. These percentages are based on computational methods provided by the University of Washington's Social Development Research Group.
